Security Change Overview and Schedule

Anti Virus Changes To Sophos

The AOC Information Technology Division is constantly educating themselves on computer security and the risks the courts face today. Our goal is to ensure files in the cloud and on desktops are extremely well protected using the most advanced software solutions available. Following research and testing, McAfee anti Virus is being replaced by Sophos End Point anti-malware solution. Replacement is a fairly seamless process and will happen in the evening of your county's scheduled upgrade date (see box). A short window of risk will exist while the old McAfee software is uninstalled and the new Sophos software is installed in its place so close all programs prior to the start time of the upgrade.

A short video detailing the advantages of Sophos and featuring the AJIN Network Administrator is available on your desktop to view at your convenience by double clicking the link shown below.

[Security Change Overview Video]

The night before your county's scheduled upgrade:

⇒ Close all programs and browsers
⇒ Restart the PC to ensure files are saved and closed
⇒ Leave the computer on and locked for the evening
