Office, State of Arizona

Rod Franklin

Network Manager
Arizona Supreme Court

Jared Nishimoto

Court Information
Systems Coordinator
Coconino County

Stewart R. Bruner

Strategic Planning Manager
AOC Information
Technology Division

TOPICS TO INCLUDE:

Misplaced Hardware—The Damage Done

When we talk about Information Security, your first thoughts are probably about protecting your computer with passwords, firewalls and anti-virus software, but if you simply leave a jump drive or laptop unattended, all the software in the world won't protect the information stored on it when someone picks it up.

Viruses—Where Do They Come From and Where Are They Now?

As computers, and the internet, have evolved, so have viruses, malware, bot networks, and system-crippling attacks. Opening an email, shopping online during work, or even just surfing Facebook can open your computer, and by connection the entire network, to attack. It's important to understand how these programs have evolved to take advantage of new technologies.

Why "Password" Isn't a Safe Password

It's a rule as old as the first computer system, yet users still need to be reminded of it. You'll learn new, more effective ways to create a secure, nearly-unbreakable password that will stand up to even the most nefarious of break-in attempts!

Phishing Scams—Don't Get Hooked!

Whether responding to an innocent-looking email, taking an online survey, or answering someone's questions on the phone, phishing scams are one of the most frequent ways information is leaked out of organizations. You will learn the warning signs to keep from biting the baited cyber-hook!
